PURPOSE

This Interpretation of Regulations (IR) provides guidelines for the design and installation of metal suspension systems for lay-in ceilings on projects under DSA jurisdiction. This IR does not preclude the use of other systems, including proprietary systems as discussed in Section 4 below or custom designed systems, when approved by DSA.

SCOPE

This IR is applicable to the design, material requirements, gravity load support, seismic load resistance, and interface with mechanical and electrical appurtenances of metal suspension ceilings with lay-in panels. It covers ceiling systems whose total weight, including luminaires, services, and other devices, does not exceed 4 pounds per square foot (PSF). Heavier systems, faceted systems, ceilings that support lateral loads from partitions, and free-floating ceilings supported by chains or cables are beyond the scope of this IR and require project-specific design and details.

Appendix A below provides a library of details illustrating the requirements of this IR. The detail library is available in REVIT format for download via the link in Section 5.9.4 below. The project's design professional (DP) is responsible to select only the appropriate details that are applicable to the project-specific scope defined on the construction drawings. The design professional is also responsible to revise the library details to provide the project-specific information where required as noted in brackets with bold and italicized text, such as "***[DP TO SPECIFY…]***". It is not permitted to reproduce the body of this IR on the construction documents, except as described in Sections 5.9, 5.10, and Appendix A below.

The primary focus of this IR is typical flat/level ceilings with mineral or glass fiber tiles, troffer light fixtures, and mechanical registers that fit into the ceiling grid. Other types of installations are also addressed but require additional design and detailing by the design professional to produce a set of code compliant details that will be reviewed and approved by DSA. General guidance is provided for sloped ceilings (see Section 2.7 below) and linear luminaires (see Appendix B below).

BACKGROUND

Metal suspension ceiling systems with lay-in tiles are a common type of ceiling construction. Providing guidelines to clarify the design and construction of these systems in compliance with code prescribed requirements promotes consistency in detailing and construction documents, efficiency of plan review, and quality field installation.

California Building Code (CBC) Section 1617A.1.21 modifies American Society of Civil Engineers Standard 7 (ASCE 7), Section 13.5.6.2 by adding an exception to the end of Section 13.5.6.2.2 and adding Section 13.5.6.2.3. ASCE 7 Section 13.5.6.2.2 requires the design and installation to comply with American Society for Testing and Materials (ASTM) standard specifications C635, C636, and E580.

1. DESIGN AND INSTALLATION REQUIREMENTS

1.1 Ceiling System Components

Components shall comply with ASTM C635 and ASTM E580 Section 5.1.

1.1.1 The ceiling grid system shall be rated heavy duty per ASTM E580 Section 5.1.1 as defined by ASTM C635. Cross runners shall have a minimum load carrying capability of 16 pounds per linear foot per ASTM E580 Section 5.3.3.

1.1.2 Main runners, cross runners, splices, expansion devices, and intersection connectors shall be designed to carry a mean ultimate test load of not less than 180 pounds in compression and tension per ASTM E580 Section 5.1.2.

1.1.3 Hanger and brace wires shall conform to ASTM A641 and the material properties required by *IR 25-1: Maximum Allowable Load for Ceiling Wires*. Hanger and brace wires shall be #12-gauge (0.106-inch diameter) or larger.

1.2 Suspension System Installation

Installation of the suspension system shall comply with ASTM C636 and ASTM E580 Section 5.2.

1.2.1 Hanger wires shall be provided on a 4-foot by 4-foot grid spacing and shall be attached to main runners. Refer to Appendix A Detail 2.35 below for a graphical illustration. Splices in hanger wires shall develop 50 percent of the wire allowable load. Only one splice is permitted in the entire length of a hanger wire. Refer to Appendix A Detail 6.10 below for a graphical illustration.

1.2.2 Hanger wires shall be provided at the ends of all main and cross runners within 8-inches of the ceiling perimeter or within one-fourth of the length of the end runner, whichever is least. Perimeter hanger wires are not required when the length of the end runner is 8-inches or less. Refer to Appendix A Detail 2.60 below for a graphical illustration.

1.2.3 Ceiling grid members shall be attached to two adjacent walls (attached condition) per ASTM E580 Section 5.2.3 and Figure 4. Ceiling grid members shall be at least 3/4-inch clear of perimeter wall angles on the other walls (free condition) per ASTM E580 Section 5.2.3 and Figure 5. Refer to Appendix A Detail 2.60 below for a graphical illustration.

1.2.4 If a wall or multiple walls are specified in a plan configuration that is not orthogonal to the ceiling grid system, the runner to wall connections shall be as follows. If the following provisions cannot be met, then a project-specific layout of main and cross runners and their connections shall be designed and specified on the construction drawings.

1.2.4.1 At least two adjacent perimeter walls shall be connected to the ceiling grid as attached.

1.2.4.2 Main runners shall be oriented in the direction that facilitates at least one end being connected to a "attached" wall condition.

1.2.4.3 One end of each main runner should be free and clear of the wall as required by Section 1.2.3 above.

1.2.4.4 Opposite ends of some cross runner lines may have the same wall connection type (i.e., attached-attached or free-free). This is permitted with non-orthogonal configurations, but the number of cross runner lines with like connections at each end should be minimized.

1.2.5 The width of the perimeter supporting closure angle shall not be less than 2-inches except as allowed by Section 1.2.6 below. Closure angle shall be screwed or otherwise positively attached to the wall studs or other supporting structure (e.g., blocking).

1.2.6 The use of angles with widths less than 2-inches in conjunction with qualified proprietary

perimeter clips may be acceptable.

1.2.6.1 Proprietary perimeter clips shall be attached to the supporting closure angle with a minimum of two screws per clip.

1.2.6.2 Proprietary perimeter clips shall be installed around the entire ceiling perimeter except that a steel pop rivet may be used at the attached sides in lieu of clips when permitted by the evaluation report.

1.2.6.3 The proprietary perimeter clip shall be qualified by approved test criteria of ASCE Section 13.5.6.2.2.a. The qualified proprietary perimeter clip shall be in accordance with Section 4 below.

1.2.7 At the unattached walls (free condition) of the ceiling perimeter an interconnection between the runners to prevent lateral spreading per ASTM E580 Section 5.2.4 shall be provided. A metal stabilizer or a #16-gauge wire with a positive mechanical connection to the runner may be used and placed within 8-inches of the wall. Where the perpendicular distance from the wall to the first parallel runner is 8-inches or less, the stabilizer or #16-gauge wire is not required. Refer to Appendix A Detail 2.60 below for a graphical illustration. The use of proprietary perimeter clips to eliminate the need for stabilization is acceptable in accordance with Section 4 below.

1.3 Lateral Force Bracing Assembly Installation

Lateral force bracing assemblies consisting of a compression strut and four #12-gauge splayed bracing wires oriented 90 degrees (in plan) from each other are required for all ceiling areas. Refer to Appendix A Detail 2.35 below for a graphical illustration.

Exception: Lateral force bracing may be omitted for suspended ceiling systems with an area of 144 square feet or less when lateral restraint is provided at all perimeter walls in accordance with CBC Section 1617A.1.21, Item #4 and ASCE 7 Section 13.5.6, Exception 1.

1.3.1 Lateral force bracing assemblies shall be spaced per Table 1 below for all values of the component importance factor (I_p) of the ceiling. Refer to Appendix A Details 2.10, 2.11, and 2.12 below for graphical illustrations. In cases where the brace assembly spacing changes over the height of the building, each level of the reflected ceiling plan shall indicate the required spacing.

TABLE 1: LATERAL FORCE BRACE ASSEMBLY SPACING

Design Spectral Acceleration Parameter, (S_{DS})	Brace Assembly Spacing	
	$z/h \le 0.5$[a]	$z/h > 0.5$[a,b]
~~$S_{DS} \le 1.15$~~	~~12'-0" x 12'-0"~~	~~12'-0" x 12'-0"~~
$1.15 < S_{DS} \le 1.73$	~~12'-0" x 12'-0"~~	8'-0" x 12'-0"
~~$S_{DS} > 1.73$~~	~~8'-0" x 12'-0"~~	~~8'-0" x 8'-0"~~

Footnotes:

1.3.2 There shall be a brace assembly located at a distance of not more than one-half of the spacing required by Table 1 above from each surrounding wall, expansion joint, and ceiling edge at any vertical offset. For example, where the brace spacing is 8-feet by 12-feet, the edge distance shall be 4-feet in the direction of the 8-foot spacing and 6-feet in the direction of the 12-foot spacing.

1.3.3 The slope of bracing wires shall not exceed 45 degrees from the horizontal plane and wires shall be taut. Splices in bracing wires shall develop the wire allowable load. The construction documents shall include a manufacturer's installation detail and specify a tested assembly number for fire-resistance-rated ceiling assemblies from a nationally recognized testing laboratory.

2.2.1 The components and installation details shall conform in every respect with the listed detail and number. Details shall clearly depict all components, including insulation materials, framing, and attachment of the design so that the assembly can be constructed and inspected accordingly.

2.2.2 Pop rivets, screws or other attachments are not acceptable unless specifically detailed in the listed construction detail(s), or an approved listing by a State Fire Marshal recognized laboratory.

2.3 Acoustical Ceiling Tile Panel Clearance

For ceiling installations utilizing acoustical tile panels of mineral or glass fiber, it is not mandatory to provide 3/4-inch clearance between the acoustical tile panels and the wall on the sides of the ceiling which are free to slip. See Section 2.4 below for other panel types. Clearance between the ceiling grid members and the walls as required by Section 1.2.3 above is required regardless of the ceiling tile material.

2.4 Other Panel Types

Panels other than mineral fiber and glass fiber acoustical tile shall weigh no more than 0.5 PSF and be positively attached to the ceiling runners by mechanical means, such as bolts, cables, carabiners, d-shaped rings, screws, or rivets. Each attachment shall have an allowable design strength to support the weight of the panel acting in any direction. A minimum of two attachments are required for each panel. For ceiling installations utilizing panels other than mineral or glass fiber, 3/4-inch clearance shall be provided between the ceiling panel and the wall on the sides of the ceiling area which are free to slip.

2.4.1 Other types of attachment, such as clips, snap-in devices, perforated lips, clamping

devices, or spring-loaded devices or hooks, can be accepted when qualified by an evaluation report per IR A-5. The attachment device shall be seismically qualified in accordance with ASCE 7 Section 13.2.5 or 13.2.6.

2.4.2 An alternate means of compliance per California Administrative Code (CAC) Section 4-304 may be used to achieve approval on a project-by-project basis of other means of attachment without an evaluation report per IR A-5. See *Procedure (PR) 18-01: Request for Alternate Design, Materials and Methods of Construction*. The alternate means of attachment shall have an allowable design strength to support the weight of the panel acting in any direction and shall be capable of maintaining that strength if the ceiling grid is distorted or out of level.

2.4.3 In lieu of direct restraint attachments, it is permitted to provide a secondary means of supporting the panel in case of panel dropout or dislodgement due to ceiling grid distortion or the ceiling grid becoming out-of-level. The secondary attachment shall have an allowable design strength to support two times the weight of the panel acting in any direction. A slack wire or cable connecting each panel to the ceiling grid or structure above are examples of secondary means of support.

2.4.4 Special attachment details complying with one of the methods outlined above shall be provided for the ceiling perimeter condition, where panels are cut or altered and where nonstandard panel sizes or edge conditions occur.

2.5 Exits

Ceilings over exit paths shall be installed in accordance with ASCE 7 Section 13.5.6.2.3, Item 1 as added by CBC Section 1617A.1.21. Splices or intersection of such runners shall be attached with through connectors such as pop rivets, screws, pins, plates with end tabs, or other approved connectors.

2.6 Free-Floating Ceilings

Free-floating ceilings (i.e., ceilings not attached to any walls) supported by wires in accordance with this IR shall be braced in accordance with Section 1.3 above, regardless of the ceiling area, unless it can be demonstrated the anticipated ceiling movement will not cause failure of the ceiling components or failure of mechanical, electrical, plumbing, or fire and life safety components and systems within the area of anticipated movement. The anticipated movement can be assumed as the hanger supports swinging to a 45-degree angle from vertical in any plan direction.

The perimeter of free-floating ceilings shall be supported by a continuous runner which is spliced in accordance with ASTM E580 Section 5.1.2.

2.7 Sloped Ceilings

Sloped ceilings with acoustical mineral or glass fiber tiles, surrounded on all sides by partition walls are permitted in accordance with the requirements of this section. Sloped ceilings not meeting the requirements of this section shall be custom designed and detailed.

2.7.1 The slope of the ceiling shall not exceed the manufacturer's published maximum slope recommendation nor 25 degrees from horizontal, whichever is less. The ceiling shall be square or rectangular in plan. The structure above the sloped ceiling may be flat or sloped in a different direction.

2.7.2 The slope shall occur across a single plane. The slope of the ceiling is to be uniform from the intersection of the wall at the lowest end of the ceiling to the intersection of the wall at the uppermost end of the ceiling. A gable or multifaceted ceiling profile can be accomplished within the parameters of these provisions by replacing a full height wall with a soffit at the ridge or

each slope transition line. The design must demonstrate the soffit construction provides strength and stiffness in the plane of the ceiling equivalent to a full height wall.

2.7.3 Specific detailing of the sloped ceiling system is required. The requirements for a level ceiling in this IR also apply to sloped ceilings. The library of details in Appendix A below does not include details specific to sloped ceilings, but the details provided for level ceilings can be modified to meet the requirements of this section. The design professional shall review manufacturer technical guides for recommended installation to assist in the development of site-specific details.

2.7.4 DSA may require structural calculations to demonstrate the adequacy of the lateral bracing system.

2.7.5 Sloped ceilings shall comply with the following detailing requirements:

2.7.5.1 Attachment of proprietary perimeter clips to the walls shall comply with Section 1.2.6 above.

2.7.5.2 Main runners are to be installed parallel (up/down) to the direction of the ceiling slope.

2.7.5.3 Runners at the bottom/lower end of the slope shall be installed as the attached side per Section 1.2.3 above.

2.7.5.4 Runners at the top/higher end of the slope shall be installed as the free side per Section 1.2.3 above.

2.7.5.5 Perimeter wall angles at the top and bottom of the slope are to be shimmed or installed with adjustable wall mounting brackets such that the bottom leg of the angle aligns with the plane of the ceiling. This is to ensure the 90-degree angle of the wall trim in relation to the runner is maintained. Bending the leg(s) of the wall angle to match the slope of the ceiling is prohibited.

2.7.5.6 Hanger wires, including slack wires, are to be installed vertical and plumb.

2.7.5.7 Compression struts are to be installed vertical and plumb in compliance with Section 1.3.4.2 above.

2.7.5.8 Brace wires are to be installed a maximum of 45 degrees from the horizontal plane.

2.7.5.9 Shims between the tiles and the grid are required to ensure panels are centered to resist sliding out.

2.7.5.10 Panel edge hold down clips are to be installed along the top of the grid to the ceiling tiles as follows:

2.7.5.10.1 For ceiling slope less than or equal to 15 degrees from horizontal: Clips are to be installed at each main runner and cross runner around the perimeter of the ceiling in the first bay adjacent to the walls. See Appendix A Detail 2.90 below.

2.7.5.10.2 For ceiling slope greater than 15 degrees but less than or equal to 25 degrees from horizontal: Clips are to be installed per the illustration in Appendix A Detail 2.90 below.

2.7.5.11 A minimum 3/4" horizontal clearance of the runners to the wall angle is to be maintained at the free sides.

2.7.5.12 The use of a 7/8-inch wall angle requires proprietary seismic clips. Each seismic clip shall be attached to the wall angle with two screws.

2.7.6 Sloped free floating ceilings are beyond the scope of this IR. The design professional is responsible to provide project-specific design (including supporting calculations) and details.

CEILING SYSTEM ALTERATION

5.9.2 Use of other notes and details created by the design professional is always acceptable provided they comply with the CBC and this IR.

5.9.3 While the Appendix A notes and details do not cover every condition that may occur on every project, they are intended to cover conditions common to most projects with suspended ceilings. It is anticipated their use will facilitate a more efficient design, plan review, and construction process.

5.9.4 An electronic drawing file of the Appendix A details in Revit LT[TM] 2024 format is available for download.

5.9.4.1 DSA provides this electronic drawing file to the design professional for convenience only. DSA is not responsible for issues of compatibility with particular computer systems or conversion to other file formats.

5.9.4.2 The requirements of this IR are in no way changed or modified by providing the design professional with this electronic drawing file.

5.9.4.3 The electronic drawing file may not be currently up to date or in conformance with the published IR. The design professional shall verify and coordinate the information with the latest published IR.

5.9.4.4 Information contained in the file may be changed or updated by DSA, and DSA has no responsibility to notify or supply the registered design professional with these changes.

5.10 Ceiling Notes and Details: Conditions of Use

The conditions and requirements for use of the ceiling notes and details in Appendix A below are as follows:

5.10.1 The details give no consideration to suitability for use in a specific application, compatibility with other building systems, appropriate use of materials or design, appearances, etc. The design professionals listed on the form *DSA 1: Application for Approval of Plans and Specifications* shall review all such qualities, features, and properties to ensure code

compliance, appropriate integration with other building systems, and proper design for the project-specific conditions.

5.10.2 When the details in Appendix A below are used, they shall be incorporated into the construction drawings submitted for DSA review and approval. Incorporation by reference alone is not permitted. Only the notes and details applicable to the scope of the project shall be incorporated in the construction documents (e.g., do not include wood connection details in the construction drawings for a concrete structure, do not include essential services building details in the construction documents for a school project, etc.).

5.10.3 Provided the content of the details is not changed, it is left to the discretion of the design professional to reconfigure (i.e., renumber, resize, etc.) the details for integration into the construction drawings.

Exception: The design professional (DP) is required to provide additional information on all details where so indicated in brackets with bold and italicized text, such as "***[DP TO SPECIFY…]***". These brackets and notes to the design professional shall be removed from the details and replaced with the applicable information.

5.10.4 These details submitted as part of the construction documents during the plan review process will be subject to plan review as follows:

5.10.4.1 It is expected no plan review comment will be made on a detail incorporated into the construction documents that is unaltered and found applicable to the project for which it is submitted.

5.10.4.2 Where a detail requires the designer to provide additional information to complete the detail before applying it to the drawings, plan review will be limited to the following:

5.10.4.2.1 A review of the additional information provided.

5.10.4.2.2 A review to determine if the detail, with the additional information, is applicable to the project for which it is submitted.

5.10.4.3 Where a detail incorporated into the construction documents has been altered beyond that described above, it will be subject to a full review for both detail content and applicability to the project for which it is submitted.

5.10.5 Where conditions not covered by the details in Appendix A below occur, project-specific design and details shall be provided by the design professional. This includes, but is not limited to, pendant luminaires, projector supports, projector screens, ceiling fans, free-floating ceilings, etc.

6. TESTING

All field testing shall be performed in the presence of the project inspector or a special inspector.

6.1 New Installations

Post-installed anchors in concrete used to support new ceiling systems shall be tested in accordance with this section.

6.1.1 Anchors for hanger wires shall be tested at a frequency of 10 percent. Power-actuated fasteners in concrete shall be field tested for 200 pounds in tension. Test loads for other post-installed anchors shall be tested in accordance with CBC Section 1910A.5.

6.1.2 Anchors for bracing wires shall be tested at a frequency of 50 percent in accordance with CBC Section 1910A.5.

6.2 Reuse of Existing Ceiling Hanger Wires and Bracing Wires

Existing hanger and bracing wires to be reused in the construction of new ceilings shall be tested in accordance with this section.

6.2.1 All existing ceiling hanger wire assemblies shall be field tested to 200 pounds. If existing hanger wires are spaced no more than 4'-0" on center each way and the first 20 tests pass, the testing frequency can be reduced to 50 percent.

6.2.2 All existing bracing wire assemblies shall be field tested to 440 pounds at a 45-degree angle from horizontal and in the plan direction the wire will be reused. If the first 20 tests pass, the testing frequency can be reduced to 50 percent.

6.2.3 Where a new wire is spliced to an existing wire, each spliced wire shall be field tested to the loads given for existing assemblies above.

6.2.4 The testing frequency reductions given in Section 6.2.1 and 6.2.2 above are not permitted for existing nonconforming buildings subject to rehabilitation in accordance with CAC Section 4-307.

[1] FOOTNOTES: If any individual fenestration product is non-compliant, products may show compliance using an area-weighted calculation. Chromogenic glazing is not included in area-weighted calculations. Area-weighted calculation shown in separate area-weighted table below.
[2] The NA6 Default Calculation can only be used for alterations or dwelling units in buildings with <= 3 habitable stories. Alterations are limited to 200ft² of site built glazing and dwelling units are limited to 250ft² or 5% of conditioned floor area. If the fenestration does not meet these conditions, the only options for determining fenestration values are NFRC Certification or the Default Tables in 110.6.
[3] Overhangs must extend past the left and right window the same distance as the depth of the overhang or greater to show an affect on the RSHGC. If an overhang does not meet this requirement, the affect of the overhang will be ignored.
